

# Tassello Steel Dryfix 10

Retractable insert, in fibreglass-reinforced polypropylene, specific to anchor Steel Dryfix 10 stainless steel helical bars. The system allows effective mechanical connection of band and widespread strengthening systems created using the Geosteel range of meshes on vertical load-bearing walls, arches and domes or for consolidation of brick and cement floor slabs subject to break-away of the bottom layer.

The Steel Dryfix 10 Insert ensures excellent mechanical properties and allows the matrix to be perfectly incorporated into the matrix of band and widespread strengthening systems created using the Geosteel range of low thickness meshes. Thanks to its chemical composition, polypropylene has a high resistance to impact and to abrasion, excellent thermal resistance and high levels of durability.

1. Perfect bonding with Steel Dryfix 10 helical bars
2. Excellent compatibility with matrices from the Geocalce range
3. Low thickness. Perfect embedding of the connection within the strengthening system
4. Quick and easy to install
5. High level of durability

---

## Areas of application

### → Intended use:

- Creation of connections for the band and widespread strengthening systems created using the Geosteel range of meshes
- Completion of mechanical anchoring for protective systems for floors subject to break-away of the bottom layer, in combination with Steel Dryfix 10

- Binding for coating facades
- Anti-collapse connection for stud walls

---

## Instructions for use

### → Preparation of substrates

The masonry must be prepared following in the instructions dictated by the PM, if appropriate

### → Preparation

The polypropylene Steel Dryfix 10 is ready-to-use. The Steel Dryfix 10 Insert is suitable for any length of Steel Dryfix 10.

### → Application

Dry joining of masonry in brick or tuff using Steel Dryfix 10 should be followed by drilling a pilot bore of an appropriate width and with a length equivalent to the length of the stapling bar that must be installed. In anticipation of the subsequent insertion of the Steel Dryfix 10 Insert on the Steel Dryfix 10 helical bar head, make the hole widening to 14 mm in diameter for the first 30 mm depth of the pilot bore. After placing the Steel Dryfix 10-12 Driver attachment

into the SDS Plus drill to engage, put the Steel Dryfix 10 bar inside the pilot bore, tapping with percussion until it is completely inserted; proceed then with the insertion of the Steel Dryfix 10 Insert on the Steel Dryfix 10 helical bar head, by simple screwing. Remove the tabs manually, or by means of a hammer, to facilitate screwing the insert. Finally, grout with appropriate geomortar (Geocalce G Antisismico, Geocalce F Antisismico, Geolite) or epoxy mineral matrix (Geolite Gel) the end of the bore and completely cover the Steel Dryfix 10 Insert to ensure perfect sealing of the bore and perfect adherence of the bar to the substrate also to the opening.

In order to specifically assess the performance of adhesion/extraction between different supports of the Steel Dryfix 10 bar only, you are advised to contact our technical office. Pull-out test is accomplished on site using a suitable test kit Steel Dryfix.

---

## Abstract

*Dry connection system using the Steel Dryfix 10 AISI 304/316 stainless steel helical bar and the Steel Dryfix 10 Insert. Execution of a dry connection system of masonry made from brick, raw earth, tuff, wood and other material by installing Steel Dryfix 10 AISI 304/316 stainless steel helical bars, installed with Helifix technology in specified pilot bore in the structure, subject to possible repair of weakened surfaces, by means of the appropriate chuck supplied Steel Dryfix 10-12 Driver attachment which is tapped into position. Subsequent insertion of the Steel Dryfix 10 Insert on the Steel Dryfix 10 helical bar head, by simple screwing.*

*They include: (1) making a pilot bore of a suitable diameter, according to the bar and to the material from which the element to be reinforced is composed; widening of the first 30 mm of the pilot bore depth to 14 mm in diameter; (2) installing the bar inside the bore by means of the appropriate Steel Dryfix 10-12 Driver attachment and possible extension according to the length of the bar; (3) insertion of the Steel Dryfix 10 Insert on the Steel Dryfix 10 helical bar head, by simple screwing; (4) final grouting of the bore and covering of the Steel Dryfix 10 Insert by appropriate material according to the type of substrate. The Steel Dryfix 10 break-fill work bar must guarantee the minimum performance characteristics of the plan, in other words: tensile breaking load > 16.2 kN; shear breaking load > 9.5 kN; modulus of elasticity > 150 GPa; ultimate elongation at rupture 3%; nominal area 14.50 mm<sup>2</sup>. The price is by unit of bar length actually laid. delivery and installation of all the materials described above as well as everything else required to finish the job is included. The following are excluded: restoration of degraded areas and repair of the substrate; material acceptance tests; pre- and post-procedure testing, all aids required to perform the work.*

---

**Technical Data compliant with Kerakoll Quality Standard**

---

Tensile strength	$F_{\text{connector}}$	> 1,5 kN
Break warp	$\epsilon_{\text{connector}}$	$\geq 50\%$
Modulus of elasticity when stretched	$E_{\text{connector}}$	1200 MPa
Head diameter	$\varnothing_{\text{head}}$	80 mm
Hole diameter	$\varnothing_{\text{shank}}$	12 mm
Shank length	$L_{\text{shank}}$	25 mm

---

## Warning

- Product for professional use
- abide by any standards and national regulations
- protect from damp and UV light
- after application, the pieces must be protected from UV light, by application of a suitable finishing layer, within 6 weeks of installation

- the product is an item according to the definitions of the EC Regulation No. 1907/2006 and therefore does not require a Safety Data Sheet
- for any other issues, contact the Kerakoll Worldwide Global Service +39 0536 811 516 - [globalservice@kerakoll.com](mailto:globalservice@kerakoll.com)
